QuotePilot

Arabic / English sales quotation agent for small suppliers

Hossam Elshahaby
Agents at Work 2026

Live app: https://quotepilotagent.lovable.app
Demo: https://youtu.be/nVatsv9ev48

Project overview

QuotePilot helps small electrical and automotive parts suppliers turn customer inquiries into quotation drafts. It interprets Arabic and English requests, checks catalog and inventory records, and calculates pricing with code. The owner reviews the result before finalization or customer sending.

The problem and the SME

Small supplier owners and sales staff manually search catalogs, verify stock, and calculate totals for each inquiry. Missing specifications and mixed-language messages add clarification work. These repeated steps take time away from customer service.

Solution and app features

The public app describes bilingual inquiry understanding, requested-item extraction, catalog matching, inventory lookup, and deterministic calculations for prices, discounts, and VAT. It also describes a tool activity log, quotation draft saving, and owner approval.

Agent workflow

1. Read the customer inquiry and extract requested items.
2. Identify missing or ambiguous information.
3. Search catalog data and check inventory.
4. Calculate the quotation using business rules.
5. Save a draft for owner review and approval.

Tool-based execution

The public activity-log example names record_extraction, search_catalog, lookup_inventory, calculate_quote, and save_quote_draft. Language interpretation supports the request, while business tools retrieve records and calculate totals. The exact model and backend framework require verification from source code.

Business value and demonstration

How it solves real business problems

Catalog and stock tools reduce repeated manual searching. Code-based calculations support consistent quotation totals. Owner review keeps uncertain matches and final sales decisions under human control. These are intended benefits, rather than measured pilot outcomes.

Impact measurement

Compare the same 10 customer inquiries manually and with the agent, using the same catalog. Include incomplete specifications and unavailable stock. Record processing time, owner review time, corrections, and quotation calculation errors.

Time saved: manual time minus agent processing time minus owner review time.
Net labor cost saved: saved hours multiplied by the SME hourly labor cost, minus incremental running costs.
Quality: product-match accuracy, correct totals, and corrections per quotation.
Revenue: track actual won orders separately from claims of additional revenue.

No measured savings or revenue results were supplied. Keep benchmark results, projections, and sample data clearly separated.

Demo journey

Open the live app, choose Open workspace, and sign in with authorized access. Use an available catalog item and enter: "Please quote 10 units of MCB 1P 16A and confirm stock." Show product matching, stock checks, tool activity, quotation totals, and owner approval. Clearly label sample data.

Open the application Watch the supplied demo video

Current status and next steps

The public hosted app is available. Feature descriptions reflect its public copy. The authenticated workflow and backend were not independently audited, and no named SME pilot or measured benchmark was supplied. The demo URL comes from the project owner. Next, run one supplier pilot and publish results including human review time.

Project author
